

Without urgent action,
climate change could
cause 14.5 million deaths
by 2050

Swipe →

The health effects of climate change are hitting the *most fragile communities* the hardest.

Extreme heat, the spread of infectious diseases, and food and water insecurity are imminent threats.

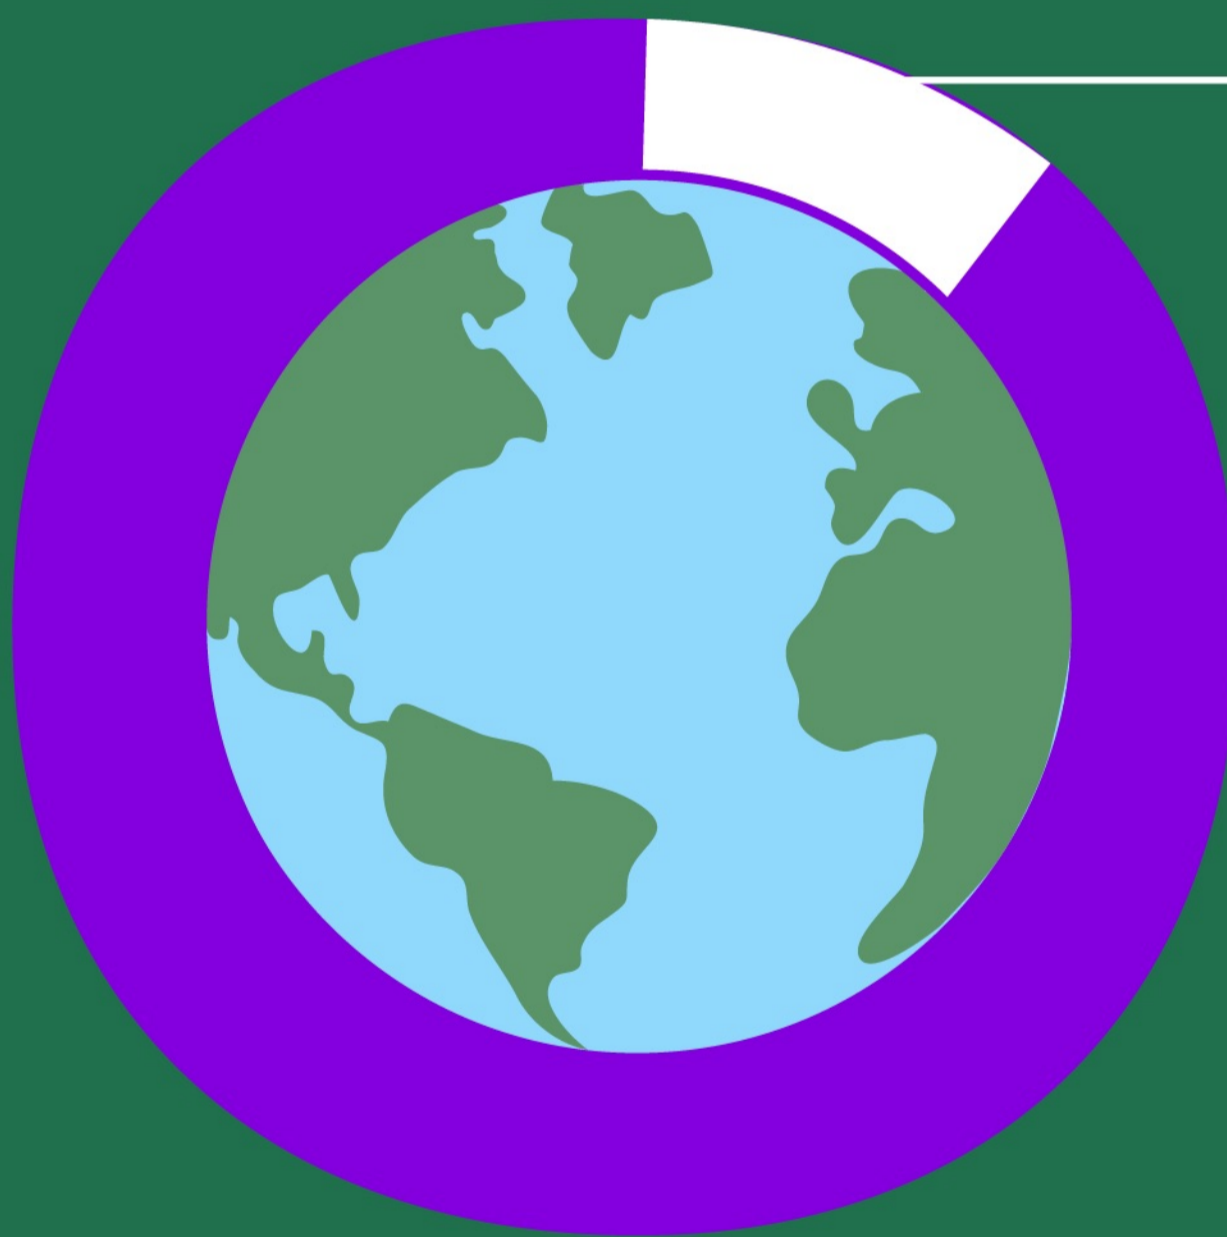

Local actors
are *uniquely
positioned*
to drive
adaptation to
these health
impacts.

●

However, *finance for locally led health adaptation* is nowhere near what is needed.

Only 10% of global climate finance reaches the local level.

Four barriers prevent finance from reaching local actors:

Funding for climate, health and locally-led adaptation is not sufficient or fit for purpose.

There is limited evidence on “what works” for locally-led health adaptation, leading to a risk-focused approach to funding.

Power imbalances exclude communities from funding decisions.

Competing priorities constrain local actors’ capacity to develop successful funding proposals.

It is vital that we *overcome these barriers and unlock fast-tracked, flexible funding for locally led health adaptation*
